**31 August 2021**

More Details:

Dear Colleagues,

Please let me invite you to contribute to the preparation and later to favour a mindful lecture of this special issue of the *Journal of Men's Health* dedicated to metastatic prostate cancer.

Although being a leading cause of cancer death, metastatic prostate cancer, compared to other cancer types, is any longer necessarily a life threatening condition. Thanks to recent pharmaceutical developments, several lines of anti-hormonal and cytostatic treatments may provide long years of disease control.

We would like to focus in this special issue to the diagnostic challenges, to the proper use of innovative therapies and to the patients' perspectives open with the improved prognosis. Differentiating between localised and generalised disease remains problematic even with the best imaging techniques. Sequencing and maintenance of novel drugs are being debated. The men's own evaluation of the quality of their prolonged life is maybe not enough taken into account.

**This special issue offers an opportunity to address the following but other topics:**

Diagnosis and treatment of oligometastatic disease, Diagnosis and treatment of micrometastatic disease, Diagnosis and treatment of neuroendocrin cancer of the prostate, Optimal selection of systemic therapies, Optimal maintenance of second line antiandrogenic therapies, Optimal comedication of androgen synthesis inhibitors, Optimal dosing of bisphosphonates, Quality of life of patients with metastatic prostate cancer

As many questions that can not be answered by referring exclusively on clinical trials, allowing therefore a considerable role to journals with smaller impact like the *Journal of Men's Health*. Your contribution is welcome in form of original article, case report, commentary and review.

Let's share our experience to the better care of the patients of all of us.

Yours,

Kullmann Tamás
