Dear Colleagues,

We would like to focus this special issue on the diagnostic challenges, to the proper use of innovative therapies and to the patients' perspectives open with the improved prognosis. Differentiating between localised and generalised disease remains problematic even with the best imaging techniques. Sequencing and maintenance of novel drugs are being debated. The men's own evaluation of the quality of their prolonged life is maybe not enough taken into account.

This special issue will offer an opportunity to review and also introduce new concepts in ED:

- Review of Diagnosis and treatment of ED
- Psychological review and assessment of ED patients
- Diagnosis and treatment of ED after prostate cancer surgery
- Optimal selection of systemic therapies
- Optimal pharmaceutical therapies
- The role of Stem Cells and ED
- New surgical techniques

Yours,

Professor Bruno Machado

Professor Ash Mosahebi
